Time Series: Theory and Methods is a systematic account of linear time series models and their application to the modeling and prediction of data collected sequentially in time. The aim is to provide specific techniques for handling data and at the same time to provide a thorough understanding of the mathematical basis for the techniques.

A time series is a series of data points indexed (or listed or graphed) in time order. Most commonly, a time series is a sequence taken at successive equally spaced points in time. Thus it is a

sequence of discrete-time data.

Examples of time series are heights of ocean tides, counts of sunspots, and the daily closing value of the Dow Jones Industrial Average.

The theory for time series is based on the assumption of 'second-order stationarity'. Real-life data are often not stationary: e.g. they exhibit a linear

trend over time, or they have a seasonal effect. So the assumptions of stationarity below apply after any trends/seasonal effects have been removed.
